GREENMAX
connecting **green** and infrastructure

Secure infrastructure with anchor screws

In a changing climate with increasingly extreme weather conditions, it is essential to securely anchor structures related to infrastructure. Anchor screws provide a reliable and efficient solution.

Anchor Screws

- Fast and easy installation with the major advantage of immediate load-bearing capacity
- Quick delivery from stock
- Fully manufactured in Europe from recycled steel
- A sustainable and high-quality alternative to a concrete foundation
- Easy-to-use, portable installation tools
- Unique system with a patented spherical head design

Anchor Screws

A safe and reliable infrastructure starts with strong anchoring

Unique foundation system

A stable foundation for technical structures is essential for the safety of our infrastructure. Due to climate change, the requirements are becoming increasingly strict. The patented anchor screws, developed by Anchor Systems International Ltd, ensure strong and stable anchoring of constructions. The unique design with a spherical head and custom-made mounting plates makes this foundation system versatile and flexible. This allows every above-ground structure to be positioned precisely on the anchor screw.

Applications

Anchor screws are used for various purposes, including guardrails along roads and railways, traffic systems, and temporary structures.

On-site support

To ensure every project is completed successfully, we offer on-site support. This ensures our solutions are installed correctly and creates the foundation for a safe and reliable above-ground infrastructure.
