

Material

- Completely natural soil improvement
- Only needs to be applied once a year
- Can be used all year round for new planting and on lawns
- Can be used all year round for maintenance of planting and lawns
- 1 m³ of vermicompost is sufficient to improve 100 m² of native soil
- Over-fertilisation is not possible
- Fewer labour hours required due to low application volume and weight
- Consistent nutrient release throughout the year
- On average, 20% more plant volume and 23% more root volume within 1 year
- Tested in completed trials: less than 0.5% plant loss
- Improved water permeability through active soil life

Soil Improvement GreenGuard Vermicompost

Vermicompost is one of the most effective fertilisers for healthy soil life and strong plant growth. GreenGuard Vermicompost is a completely natural soil improver.

Optimal soil structure and nutrient balance

The large quantity of protozoa present provides plant-available nitrogen and supports the soil food web in converting organic matter into nutrients. This improves the nutrient balance in the soil.

Long-lasting effect

GreenGuard Vermicompost is based on humus in which nutrients are bound, resulting in a long-lasting effect. One annual application is sufficient. It improves moisture regulation and stimulates active soil life, increasing the soil's natural fertility.

Applicable everywhere

GreenGuard Vermicompost is suitable for every soil type and plant species. Due to its slow nutrient release, there is no risk of over-fertilisation. It is easy to apply: mix it into the top layer of soil, spread it over the lawn, or use it in the planting hole.
